

How to work out your cladding requirements

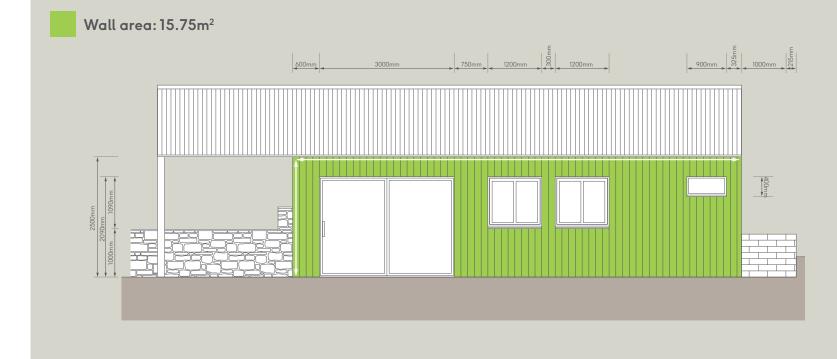

Important guidance

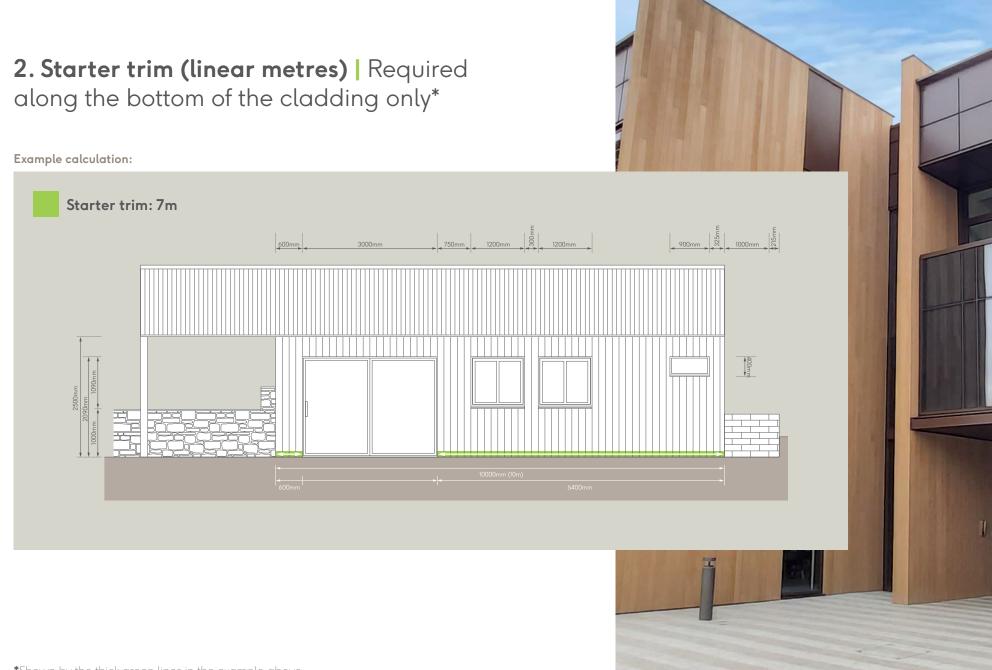

If a PDF drawing can't be provided for a take-off, please complete the form on page 8 of this document and include all of the following information...

1. The area (m²) | Total wall area to be clad*

Example calculation:

^{*}Minus the area of the doors and windows.

^{*}Shown by the thick green lines in the example above.

3. Perforated closure (linear metres) | Required as shown below*

- The bottom of the cladding
- Along the roof line where the cladding meets the soffit
- The top and bottom of the windows
- Top of the doors (bottom of doors is only required if the cladding runs under the door)

Example calculation:

4. Reveals around the windows and doors Required as shown below*

Example calculation:

5. Number of full-length corner pieces, or linear meterage of corner profile | Required as shown below*

To get two corners out of one piece we would need the total length of both pieces to be less than 3m, obviously if the corner is more than 3m a second piece will be required, please bear in mind that a good installer will keep the joint below or above eye level.

Corner trims will also be required where cladding comes up against an alternative finish on the same wall such as render.

Live.Life.Outside.

Cladding requirements | Submission form

Please email this information to	nquiries@millboard.co.uk for a bill of quantities	s/material list.		
Customer reference:	Do	ite: (DD/MM/YYYY)
